CLINICAL FOCUS

Dr. Findikcioğlu's clinical practice is centered on the surgical treatment of thoracic disease. A major part of his work concerns lung cancer and other thoracic cancers, including chest wall tumors and tumors of the mediastinum. He performs lung surgery using minimally invasive and robotic approaches.

He also treats pneumothorax, diaphragmatic disorders and thoracic outlet syndrome, and provides surgical care for chest wall deformities, including pectus excavatum and pectus carinatum. These conditions fall within the wider field of cardiothoracic surgery. Whether a patient is a candidate for surgery, and which approach is appropriate, depends on the individual diagnosis, imaging findings and general health.

Diaphragmatic disorders

INTERNATIONAL PATIENTS

Dr. Findikcioğlu speaks Turkish and English, and interpreters can be arranged for patients who speak other languages. Before a visit, the international patient team coordinates the collection of prior reports and imaging — for example CT, MRI or X-ray reports, laboratory and pathology results, operative notes and discharge summaries — and arranges appointments and the hospital visit.
