CLINICAL FOCUS

A central part of Dr. Sabancı's work is root canal treatment. This is considered when the soft tissue inside a tooth has become inflamed or infected, for example as a result of deep decay, a crack or a previous restoration that has failed. The aim is to remove the affected tissue, clean and shape the canals and seal them so that the tooth can be retained rather than removed.

She also manages tooth root infection, including cases that present with pain, swelling or sensitivity around a tooth. Assessment typically involves a clinical examination and dental imaging to establish the source and extent of the problem before any treatment is proposed. In addition, Dr. Sabancı provides dental fillings to restore teeth affected by decay or minor damage and to rebuild teeth after endodontic treatment.

INTERNATIONAL PATIENTS

Dr. Sabancı consults in Turkish and English, and interpreters can be arranged for patients who speak other languages. Before a visit, the Acibadem international patient team coordinates the collection of prior reports and imaging, such as dental X-rays, CT reports, previous treatment records and discharge summaries, and arranges appointments and the hospital visit.
