CLINICAL FOCUS

A substantial part of Dr. Saygılı's practice is dedicated to the dental care of children. This includes preventive measures such as fluoride application and fissure sealants, which are intended to help protect teeth from decay, as well as space maintainers, which may be used when a primary tooth is lost early so that room is kept for the permanent tooth that follows.

In restorative and endodontic care, Dr. Saygılı performs dental fillings and root canal treatment for both primary and permanent teeth, and she manages dental root infections. She treats dental trauma, such as injuries to the teeth following a fall or impact, where timely assessment can influence the options available. Where a tooth cannot be preserved, tooth extraction is carried out as part of an overall treatment plan.

Space maintainers

Root canal treatment for primary teeth

Root canal treatment for permanent teeth

Dental treatment under general anesthesia

Fluoride application

INTERNATIONAL PATIENTS

Dr. Saygılı consults in Turkish and English, and interpreters can be arranged for patients who speak other languages. Before a visit, the Acibadem international patient team coordinates the collection of prior reports and imaging, for example dental X-rays, CT reports, previous treatment records and discharge summaries, and arranges appointments and the hospital visit.
